Video: Taxonomy (full video): Watched 5:10 of 5:24 (96%), complete.
Clip (Part 1): Cell type and how organisms get food (3:20 to 4:15): Watched 0:55 of 0:55 (100%), complete.
Clip (Part 2): Linnaeus, shared traits, and DNA evidence (0:53 to 2:07): Watched 1:15 of 1:15 (100%), complete.
Clip (Part 3): The eight ranks and the memory trick (2:07 to 2:37): Watched 0:31 of 0:31 (100%), complete.
Clip (Part 4): The three domains (3:20 to 3:58): Watched 0:20 of 0:39 (51%).
Clip (Part 4): The four kingdoms of Eukarya (3:58 to 4:49): Watched 0:51 of 0:51 (100%), complete.
Clip (Part 5): Binomial nomenclature and why scientific names matter (2:37 to 3:20): Watched 0:44 of 0:44 (100%), complete.
Auto-checked items: 37 / 37 correct
Written responses: 2 / 2 completed

Questions and answers

1. Match each description to the correct word.

Has no nucleus
Prokaryote
(correct)

Has a nucleus
Eukaryote
(correct)

Makes its own food
Autotroph
(correct)

Gets food by consuming other organisms
Heterotroph
(correct)

Body is made of one cell
Single-celled
(correct · 1 wrong try)

Body is made of many cells
Multicellular
(correct)

2. Scientists have changed how living things are classified over time. Why is it not enough to group organisms only by how they look, and how does DNA evidence help? Use at least one idea from the video. (2 to 4 sentences)

It is not enough to group organisms only by how they look because looks can trick you. According to the video, scientists used to sort living things by shared traits they could see, but now they also compare

DNA. For example, two organisms can look alike because they live the same way, even if they are not closely related. DNA shows which organisms really share a common ancestor, so the groups match how living things are actually related.

(78 words, claim (blue) 17, evidence (yellow) 22, expand (green) 39 words highlighted)

3. Put the levels in order, from the broadest group to the most specific group.

Spot 1

Domain

(correct)

Spot 2

Kingdom

(correct)

Spot 3

Phylum

(correct · 1 wrong try)

Spot 4

Class

(correct)

Spot 5

Order

(correct)

Spot 6

Family

(correct · 2 wrong tries)

Spot 7

Genus

(correct)

Spot 8

Species

(correct)

4. Make your own memory trick. Write a silly sentence where each word starts with the first letter of a level, in order: D, K, P, C, O, F, G, S. The video shares one. Make yours different if you can.

Dolphins Keep Playing Catch On Foggy Gray Saturdays

(correct)

5. Pick the domain for each organism. For the organisms in domain Eukarya, also pick the kingdom.

Human: domain

Eukarya

(correct)

Human: kingdom

Animalia

(correct)

Sunflower: domain

Eukarya

(correct)

Sunflower: kingdom

Plantae

(correct)

Button mushroom: domain

Eukarya

(correct)

Button mushroom: kingdom

Fungi

(correct)

Amoeba (single-celled, has a nucleus): domain

Eukarya

(correct)

Amoeba (single-celled, has a nucleus): kingdom

Protista

(correct · 1 wrong try)

E. coli (lives in your gut, no nucleus): domain

Bacteria

(correct)

Halobacterium (lives in extremely salty lakes, no nucleus): domain

Archaea

(correct)

6. Which scientific name for humans is written correctly?

Homo sapiens

(correct · 1 wrong try)

7. The sea otter is *Enhydra lutris*. What is its species (the specific epithet)?

lutris

(correct)

8. When you write a scientific name by hand, how do you show it is a scientific name?

Underline it

(correct)

9. Why do scientists use scientific names instead of only common names?

Scientific names are standardized and the same worldwide

(correct)

10. The white oak is *Quercus alba*. Choose the genus and the species.

Genus

Quercus

(correct)

Species

alba

(correct · 1 wrong try)

11. This sea otter name is written incorrectly: *enhydra Lutris*. Type it correctly (capitalization matters).

Enhydra lutris

(correct)

12. Carl Linnaeus developed the binomial nomenclature system for naming species, which is still in use today. Discuss the advantages of using scientific names over common names when identifying species. Provide examples from the video, such as the mountain lion (also called a cougar or a puma), to explain why scientific names are important for consistency in classification.

One advantage of scientific names is that every scientist in the world uses the same name for the same species. According to the video, the mountain lion is also called a cougar or a puma, but its scientific name is always Puma concolor. This shows that common names can change from place to place and

cause confusion. A scientific name has two parts, the genus and the species, so it tells you exactly which organism someone means and keeps classification consistent.

(81 words, claim (blue) 20, evidence (yellow) 23, expand (green) 38 words highlighted)

13. Which two organisms are in the same family?

Bottlenose dolphin and orca

(correct)

14. Which organism is NOT in class Mammalia?

Great white shark

(correct · 1 wrong try)

15. What is the genus of the blue whale?

Balaenoptera

(correct)

16. Which organisms share the MOST levels of classification with each other?

Bottlenose dolphin and orca

(correct)

17. True or false: the bottlenose dolphin and the orca are in the same genus.

False

(correct)
